“Small project #1” (the same for all)

**Flight recorder simulator**

The aim of this project is to provide an application that would act as flight parameters recorder. It must work all the time during the flight and store the parameters for an inspection if necessary. The stuff we need to think of is:

- How do we get the data to monitor? Cannot give you a plane to play folks!
- How to store the data? There may be a lot of them!
- We need some graphical interface to present the data. Can be just a set of plots, can be a fully-fledged GUI.

Please have an initial project ready for the next lab.
