Knowledge-Based Computational Intelligence and Data Mining in Biomedicine

Laboratory 1-2: Assignments

Adrian Horzyk

horzyk@agh.edu.pl

**AGH University of
Science and Technology
Krakow, Poland**

What should you learn to accomplish this course?

Popular Notebooks:
Jupyter Notebook

Google Colab

Popular frameworks:

- **Tensorflow 2.0**
- **Keras**

Popular libraries:

- **numpy**
- **scikit-learn**
- **pandas**
- **mxnet**
- **matplotlib**

Laboratory Assignments

What should you be able to do after these laboratories finish:

➢ Use CI tools like RapidMiner to analyze data, construct models, train them, optimizing hyperparameters.

➢ Develop CI models and use various methods and hyperparameters to solve different tasks and achieve good performance (high generalization accuracy and a low error), using Python frameworks (e.g. Keras) and libraries. Tune, regularize, optimize developed models and adapt various learning strategies. Create classifiers, detectors, regressors, and/or clustering models – details will be given during the laboratories.

➢ Implement a data mining model searching for frequent patterns using your skills and experience in any programming language like Python, C++, C#, or Java.

➢ Implement associative structures, search for similarities and groups of objects, and construct recommendation tools using your skills and experience in any programming language like Python, C++, C#, or Java.

Project Assignments

Your project assignment (in the 2nd part of the semester) should:

➢ Solve one chosen biomedical task and achieve high performance and high quality of the project together with nice interface, description and the presentation of results.

➢ Choose or prepare training data you want to work with.

➢ Develop one or more computational models and try to optimize them to solve the chosen biomedical problem.

➢ Use various hyperparameters, optimizers, training techniques to increase accuracy, and decrease errors.

➢ Take care about the generalization of the model to be high!

➢ You can also implement your solution from scratch not using only the high-level functions that implement models, but you can use your programming skills and experience in any programming language, e.g. Python, C++, C# or Java.

Assignments for Lab 1

Learn RapidMiner - a useful computational tool:

➤ It allows you to develop computational intelligence and data mining models, train them and use them in practice.

➤ Construct some solutions using RapidMiner blocks and links.

➤ Go through the Rapid Miner tutorials (built-in the Rapid Miner)(built-in the Rapid Miner) and build classifiers for a chosen dataset using a few CI methods and blocks like Optimize Parameters, Compare ROCs, Cross Validation, Normalize, etc. to get better performance of the model.

➤ **Prepare your Rapid Miner solution. It will be graded at the and of the 1st part of the semester (at the end of the laboratory classes).**

➤ Learn Python at the basic level at least before we start Laboratory 2.

RapidMiner

✓ [RapidMiner](#) is a data science platform for CI model development and machine learning.

✓ It focuses on four groups of problems:

- **classification**

- **clustering**

- **regression**

- **data mining**

RapidMiner

✓ Go through the tutorial and complete tasks:

RapidMiner

Finally, choose one of the following task:

- Classification

- Clustering

- Regression

- Data mining

and an interesting dataset from ML Repository or other repositories (possibly biomedical data) about which would you like to learn something new, and create a computational intelligence or data mining model using Rapid Miner. Gather results and prepare a presentation.

RapidMiner

Experiment with new abilities of RapidMiner Studio:

- Turbo Prep – turbo preparation of data

- Auto Model – the construction of CI model semi-automatically
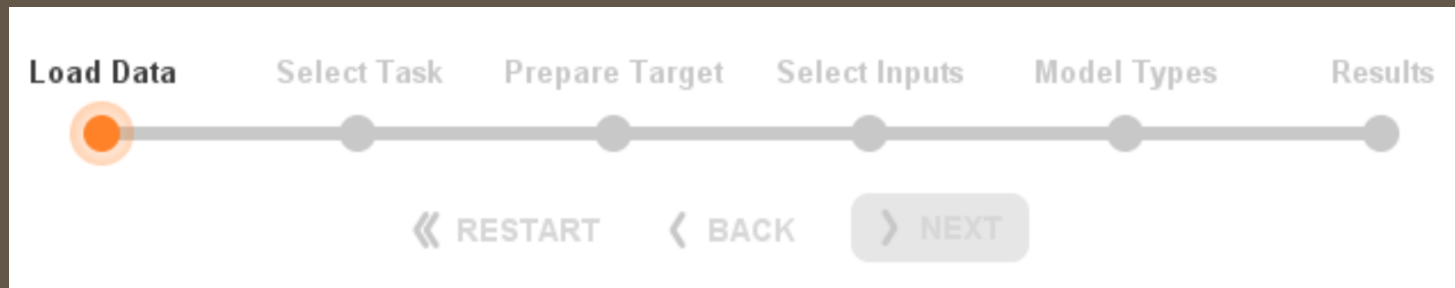

but create your model for this assignment
not using this automatic tools!

Assignments for Lab 2

Start your experience with Python, Notebooks and deep learning models and methods:

- Get familiar with the Jupyter Notebook and Google Colab, download sample notebooks from my website and run them:

- MNIST Classification Notebook:

- CIFAR-10 Classification Notebook:

JUPYTER NOTEBOOKS

MNIST Classification

CIFAR-10 Classification

- Get familiar with the codes presenting the models for the classification of MNIST and CIFAR-10 datasets.

- Learn Python at the intermediate level before we start Laboratory 3.

- You will be expected to create a classifier or any other predictor (regressor) in one of the next laboratory.

Running a Jupyter Notebook in your browser:

- When the Jupyter Notebook opens in your browser, you will see the Jupyter Notebook Dashboard, which will show you a list of the notebooks, files, and subdirectories in the directory where the notebook server was started by the command line „jupyter notebook".

- Most of the time, you will wish to start a notebook server in the highest level directory containing notebooks. Often this will be your home directory.

Jupyter

Start a new Python notebook:

- **Clicking New → Python 3**
- **And a new Python project in the Jupyter Notebook will be started:**
In the next assignments and examples, we well use the following packages:

- **numpy is the fundamental package for scientific computing with Python.**

- **h5py is a common package to interact with a dataset that is stored on an H5 file.**

- **matplotlib is a famous library to plot graphs in Python.**

- **PIL and scipy are used here to test your model with your own picture at the end.**

They must be imported:

```
In [2]:  import numpy as np
         import matplotlib.pyplot as plt
         import h5py
         import scipy
         from PIL import Image
         from scipy import ndimage
         from lr_utils import load_dataset

         %matplotlib inline
```

Import of libraries and setting of the parameters:

In [1]:

```python
'''Trains a simple ConvNet on the MNIST dataset. It gets over 99.60% test accuracy after 48 epochs
(but there is still a margin for hyperparameter tuning). Training can take an hour or so!'''

# Import libraries
from __future__ import print_function
import numpy as np
import math
from math import ceil
import tensorflow as tf
import os
import seaborn as sns
import matplotlib.pyplot as plt  # library for plotting math functions
import pandas as pd
import keras    # Import keras framework with various functions, models and structures
from keras.datasets import mnist # gets MNIST dataset from repository
from keras.models import Sequential
from keras.layers import Dense, Dropout, Flatten
from keras.layers import Conv2D, MaxPooling2D
from keras import backend as K
from keras.preprocessing.image import ImageDataGenerator
from keras.callbacks import ReduceLROnPlateau
from sklearn import metrics
from sklearn.metrics import confusion_matrix, classification_report

# Set parameters for plots
%matplotlib inline
plt.rcParams['image.interpolation'] = 'nearest'
plt.rcParams['image.cmap'] = 'gray'

print ("TensorFlow version: " + tf.__version__)
```

TensorFlow version: 2.1.0

Defining of hyperparameters and the function presenting results:

In [2]:
```python
LABELS = ['0', '1', '2', '3', '4', '5', '6', '7', '8', '9']

# Define the confusion matrix for the results
def show_confusion_matrix(validations, predictions, num_classes):
    matrix = metrics.confusion_matrix(validations, predictions)
    plt.figure(figsize=(num_classes, num_classes))
    hm = sns.heatmap(matrix,
                cmap='coolwarm',
                linecolor='white',
                linewidths=1,
                xticklabels=LABELS,
                yticklabels=LABELS,
                annot=True,
                fmt='d')
    plt.yticks(rotation = 0)  # Don't rotate (vertically) the y-axis labels
    hm.invert_yaxis() # Invert the labels of the y-axis
    hm.set_ylim(0, len(matrix))
    plt.title('Confusion Matrix')
    plt.ylabel('True Label')
    plt.xlabel('Predicted Label')
    plt.show()
```

In [3]:
```python
# Define hyperparameters
batch_size = 512    # size of mini-baches
num_classes = 10    # number of classes/digits: 0, 1, 2, ..., 9
epochs = 3          # how many times all traing examples will be used to train the model

# Input image dimensions
img_rows, img_cols = 28, 28

# Split the data between train and test sets
(x_train, y_train), (x_test, y_test) = mnist.load_data() # 60000 training and 10000 testing example
```

MNIST Classification in Jupyter Notebook

Sample training examples from MNIST set (handwritten digits):

In [4]:

```python
# Show a few sample digits from the training set
plt.rcParams['figure.figsize'] = (2.5, 2.5) # set default size of plots
col1 = 10
row1 = 1
fig = plt.figure(figsize=(col1, row1))
for index in range(0, col1*row1):
    fig.add_subplot(row1, col1, index + 1)
    plt.axis('off')
    plt.imshow(x_train[index]) # index of the sample picture
    plt.title("Class " + str(y_train[index]))
plt.show()

# Show a few sample digits from the training set
plt.rcParams['figure.figsize'] = (1.0, 1.0) # set default size of plots
col2 = 20
row2 = 10
fig = plt.figure(figsize=(col2, row2))
for index in range(col1*row1, col1*row1 + col2*row2):
    fig.add_subplot(row2, col2, index - col1*row1 + 1)
    plt.axis('off')
    plt.imshow(x_train[index]) # index of the sample picture
plt.show()
```

MNIST Classification in Jupyter Notebook
Loading training data, changing the shapes of the matrices storing training and test data, transformation of the input data from [0, 255] to [0.0, 1.0] range, and conversion of numeric class names into categories:

In [5]:

```python
# According to the different formats reshape training and testing data
if K.image_data_format() == 'channels_first':
    x_train = x_train.reshape(x_train.shape[0], 1, img_rows, img_cols)
    x_test = x_test.reshape(x_test.shape[0], 1, img_rows, img_cols)
    input_shape = (1, img_rows, img_cols)
else:
    x_train = x_train.reshape(x_train.shape[0], img_rows, img_cols, 1)
    x_test = x_test.reshape(x_test.shape[0], img_rows, img_cols, 1)
    input_shape = (img_rows, img_cols, 1)

# Transform training and testing data and show their shapes
x_train = x_train.astype('float32')    # Copy this array and cast it to a specified type
x_test = x_test.astype('float32')      # Copy this array and cast it to a specified type
x_train /= 255    # Transfrom the training data from the range of 0 and 255 to the range of 0 and 1
x_test /= 255     # Transfrom the testing data from the range of 0 and 255 to the range of 0 and 1
print('x_train shape:', x_train.shape)
print(x_train.shape[0], 'train samples')
print(x_test.shape[0], 'test samples')

# Convert class vectors (integers) to binary class matrices using as specific
y_train = keras.utils.to_categorical(y_train, num_classes) # y_train - a converted class vector int
y_test = keras.utils.to_categorical(y_test, num_classes) # y_test - a converted class vector into c
```

```
x_train shape: (60000, 28, 28, 1)
60000 train samples
10000 test samples
```

Building a neural network structure (computational model):

In [6]:

```python
# Define the sequential Keras model composed of a few layers
model = Sequential()   # establishes the type of the network model
# Conv2D - creates a convolutional layer (https://keras.io/layers/convolutional/#conv2d) with
# filters - specified number of convolutional filters
# kernel_size - defines the frame (sliding window) size where the convolutional filter is implement
# activation - sets the activation function for this layers, here ReLU
# input_shape - defines the shape of the input matrix (vector), here input_shape = (1, img_rows, in
model.add(Conv2D(filters=32, kernel_size=(3, 3),activation='relu', input_shape=input_shape))
# model.add(Conv2D(32, (3, 3), activation='relu')) - shoter way of the above code
# MaxPooling2D pools the max value from the frame (sliding window) of 2 x 2 size
model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.20)) # Implements the drop out with the probability of 0.20
model.add(Conv2D(64, (3, 3), activation='relu',padding='same'))
model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.25))
model.add(Conv2D(128,(3, 3), activation='relu',padding='same'))
model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.30))
model.add(Conv2D(256,(3, 3), activation='relu',padding='same'))
#model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.40))
model.add(Conv2D(512,(3, 3), activation='relu',padding='same'))
#model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.50))
# Finish the convolutional model and flatten the layer which does not affect the batch size.
model.add(Flatten())
# Use a dense layer (MLP) consisting of 256 neurons with relu activation functions
model.add(Dense(256, activation='relu'))
model.add(Dropout(0.35))
model.add(Dense(128, activation='relu'))
model.add(Dropout(0.25))
model.add(Dense(num_classes, activation='softmax'))
```

Compilation, optimization, data generation, augmentation and learning:

In [8]: ▶

```python
# Compile the model using optimizer
model.compile(loss=keras.losses.categorical_crossentropy,
              optimizer=keras.optimizers.Adadelta(),  # choose the optimizer
              metrics=['acc']) # List of metrics to be evaluated by the model during training and t

# Learning rate reduction durint the training process: https://keras.io/callbacks/#reducelronplatea
learning_rate_reduction = ReduceLROnPlateau(monitor='val_acc', # quantity to be monitored (val_loss
                                            factor=0.5, # factor by which the learning rate will be
                                            patience=5, # number of epochs that produced the monito
                                            verbose=1,  # 0: quiet, 1: update messages.
                                            min_lr=0.001) # Lower bound on the learning rate

# Augmentation of training data. It generates batches of tensor image data with real-time data augm
datagen = ImageDataGenerator(
        rotation_range=5, # rotate images in degrees up to the given degrees
        zoom_range=0.2, # zoom images
        width_shift_range=0.15,  # shift images horizontally
        height_shift_range=0.15)  # shift images vertically
# Computes the internal data stats related to the data-dependent transformations, based on an array
datagen.fit(x_train) # Fits the data generator to the sample data x_train.

# Simple train the model, validate, evaluate, and present scores
'''history = model.fit(x_train, y_train,
        batch_size=batch_size,
        epochs=epochs,  # no of training epochs
        verbose=1,  # 0 = silent, 1 = progress bar, 2 = one line per epoch
        validation_data=(x_test, y_test),
        validation_split=0.2,  # cross-validation split 1/5
        shuffle=True) # method of how to shuffle training and validation data '''

# Advanced train the model, validate, evaluate, and present scores: https://keras.io/models/model/#
history = model.fit_generator(datagen.flow(x_train, y_train, batch_size=batch_size),
                              epochs=epochs,  # no of training epochs
                              steps_per_epoch=x_train.shape[0]//batch_size, # no of mini-batches
                              validation_data=(x_test, y_test),
                              verbose=1,  # 0 = silent, 1 = progress bar, 2 = one line per epoch
                              callbacks=[learning_rate_reduction])
```

Model evaluation, convergence drawing and error charts:

```
Epoch 1/3
117/117 [==============================] - 239s 2s/step - loss: 1.9395 - acc: 0.2978 - val_loss: 1.0056 - val_acc: 0.6138
Epoch 2/3
117/117 [==============================] - 254s 2s/step - loss: 0.8777 - acc: 0.7117 - val_loss: 0.1801 - val_acc: 0.9456
Epoch 3/3
117/117 [==============================] - 252s 2s/step - loss: 0.3709 - acc: 0.8885 - val_loss: 0.0808 - val_acc: 0.9753
```

Evaluate, score and plot the accuracy and the loss

In [8]:

```python
# Evaluate the model and print out the final scores for the test set
score = model.evaluate(x_test, y_test, verbose=0)  # evaluate the model on the test set
print('Test loss:', score[0])      # print out the loss = score[0] (generalization error)
print('Test accuracy:', score[1])  # print out the generalization accuracy = score[1] of the model on test set

# Plot training & validation accuracy values: https://keras.io/visualization/#training-history-visualization
plt.rcParams['figure.figsize'] = (15.0, 5.0) # set default size of plots
plt.plot(history.history['acc']) # The history object gets returned by the fit method of models.
plt.plot(history.history['val_acc'])  # val_accuracy
plt.title('Model accuracy')
plt.ylabel('Accuracy')
plt.xlabel('Epoch')
plt.legend(['Train', 'Test'], loc='upper left')  # OR plt.legend(['Train', 'Validation'], loc='upper left')
plt.show()

# Plot training & validation loss values: https://keras.io/visualization/#training-history-visualizatio
plt.plot(history.history['loss']) # The history object gets returned by the fit method of models.
plt.plot(history.history['val_loss'])
plt.title('Model loss')
plt.ylabel('Loss')
plt.xlabel('Epoch')
plt.legend(['Train', 'Test'], loc ='upper left')  # OR plt.legend(['Train', 'Validation'], loc='upper left')
plt.show()
```

```
Test loss: 0.08078844527509063
Test accuracy: 0.9753000140190125
```

Model evaluation, convergence drawing and error charts:

```
Test loss: 0.08078844527509063
Test accuracy: 0.9753000140190125
```

Here is the presentation of only 3 learning epochs!
We usually train such networks for several dozen epochs,
getting better results (accuracy) and smaller errors!

Why results on test data are better than on train data?

Mini-batch mode and regularization mechanisms, such as Dropout and L1/L2 weight regularization,
are turned off at the testing time, so the model does not change as during training time.
That is why the train error is always bigger, which can appear weird
in view of classic machine learning models.

Generation of summaries of the learning process

```python
In [11]:    # Use the trained model for predictions of the test data
            y_pred_test = model.predict(x_test)

            # Take the class with the highest probability from the test predictions as a winning one
            max_y_pred_test = np.argmax(y_pred_test, axis=1)
            max_y_test = np.argmax(y_test, axis=1)

            # Show the confution matrix of the collected results
            show_confusion_matrix(max_y_test, max_y_pred_test, num_classes)

            # Print classification report
            print(classification_report(max_y_test, max_y_pred_test))
```

	precision	recall	f1-score	support
0	0.98	0.99	0.99	980
1	1.00	0.98	0.99	1135
2	0.97	0.98	0.98	1032
3	0.95	0.99	0.97	1010
4	0.99	0.96	0.98	982
5	0.96	0.99	0.97	892
6	0.97	0.98	0.98	958
7	0.99	0.96	0.98	1028
8	0.97	0.97	0.97	974
9	0.95	0.96	0.96	1009
accuracy			0.98	10000
macro avg	0.98	0.98	0.98	10000
weighted avg	0.98	0.98	0.98	10000

Generation of a confusion (error) matrix in the form of a heat map:

Confusion Matrix
Counting and filtering incorrectly classified test data:

In [10]:

```python
# Find out misclassified examples
classcheck = max_y_test - max_y_pred_test   # 0 - when the class is the same, 1 - otherwise
misclassified = np.where(classcheck != 0)[0]
num_misclassified = len(misclassified)

# Print misclassification report
print('Number of misclassified examples: ', str(num_misclassified))
print('Misclassified examples:')
print(misclassified)

# Show misclassified examples:
print('Misclassified images (original class : predicted class):')
plt.rcParams['figure.figsize'] = (2.5, 2.5) # set default size of plots
col = 10
row = 2 * math.ceil(num_misclassified / col)
fig = plt.figure(figsize=(col, row))
for index in range(0,num_misclassified):
    fig.add_subplot(row, col, index + 1 + col*(index//col))
    plt.axis('off')
    plt.imshow(x_test[misclassified[index]].reshape(img_rows, img_cols)) # index of the test sample picture
    plt.title(str(max_y_test[misclassified[index]]) + ":" + str(max_y_pred_test[misclassified[index]]))
plt.show()
```

```
Number of misclassified examples:  247
Misclassified examples:

247 out of 10,000 incorrectly classified test patterns:

One might wonder why the network had difficulty in classifying them?

Of course, such a network can be taught further to achieve a smaller error!

This network was taught only for 3 epochs!

Misclassified images (original class : predicted class):

Now, let's try to train the network for 50 epochs:

```
Epoch 1/50
117/117 [==============================] - 271s 2s/step - loss: 1.9644 - acc: 0.2841 - val_loss: 0.8554 - val_acc: 0.6723

Test accuracy: 0.9962999820709229
```

Model accuracy

Model loss

Why results on test data are better than on train data?

Mini-batch mode and regularization mechanisms, such as Dropout and L1/L2 weight regularization, are turned off at the testing time, so the model does not change as during training time. That is why the train error is always bigger, which can appear weird in view of classic machine learning models.

The confusion matrix has also improved: more patterns migrate towards the diagonal (correct classifications) from other regions:

The number and the accuracy of correctly classified examples for all individual classes increase:

	precision	recall	f1-score	support
0	0.98	0.99	0.99	980
1	1.00	0.98	0.99	1135
2	0.97	0.98	0.98	1032
3	0.95	0.99	0.97	1010
4	0.99	0.96	0.98	982
5	0.96	0.99	0.97	892
6	0.97	0.98	0.98	958
7	0.99	0.96	0.98	1028
8	0.97	0.97	0.97	974
9	0.95	0.96	0.96	1009
accuracy			0.98	10000
macro avg	0.98	0.98	0.98	10000
weighted avg	0.98	0.98	0.98	10000

	precision	recall	f1-score	support
0	1.00	1.00	1.00	980
1	1.00	1.00	1.00	1135
2	1.00	1.00	1.00	1032
3	0.99	1.00	1.00	1010
4	0.99	1.00	1.00	982
5	1.00	0.99	0.99	892
6	1.00	0.99	1.00	958
7	1.00	1.00	1.00	1028
8	1.00	1.00	1.00	974
9	1.00	0.99	0.99	1009
accuracy			1.00	10000
macro avg	1.00	1.00	1.00	10000
weighted avg	1.00	1.00	1.00	10000

However, we can see that the process of network training is not over yet and should be continued for several dozen epochs.

The number of misclassified examples after 50 epochs compared to 3 epochs has dropped from 247 to 37 out of 10,000 test examples, resulting in an error of 0.37%. Here are the misclassified examples:

```
Number of misclassified examples:  37
Misclassified examples:

CIFAR-10 Classification in Jupyter

Classification of images 32 x 32 pixels to 10 classes (3 learning epochs):

Class [6] Class [9] Class [9] Class [4] Class [1] Class [1] Class [2] Class [7] Class [8] Class [3]
Create the network structure

In [6]:

```python
# Define the sequential Keras model composed of a few layers
model = Sequential()   # establishes the type of the network model
# Conv2D - creates a convolutional layer (https://keras.io/layers/convolutional/#conv2d) with
# filters - specified number of convolutional filters
# kernel_size - defines the frame (sliding window) size where the convolutional filter is implemented
# activation - sets the activation function for this layers, here ReLU
# input_shape - defines the shape of the input matrix (vector), here input_shape = (1, img_rows, img_cols)
model.add(Conv2D(64, kernel_size=(3, 3),activation='relu', input_shape=input_shape))
model.add(Conv2D(64, (3, 3), activation='relu'))
# MaxPooling2D pools the max value from the frame (sliding window) of 2 x 2 size
model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.25)) # Implements the drop out with the probability of 0.25
model.add(Conv2D(128, (3, 3), activation='relu',padding='same'))
model.add(Conv2D(128, (3, 3), activation='relu',padding='same'))
model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.25))
model.add(Conv2D(256, (3, 3), activation='relu',padding='same'))
model.add(Conv2D(256, (3, 3), activation='relu',padding='same'))
model.add(MaxPooling2D(pool_size=(2, 2)))
model.add(Dropout(0.35))
# Finish the convolutional model and flatten the layer which does not affect the batch size.
model.add(Flatten())
# Use a dense layer (MLP) consisting of 256 neurons with relu activation functions
model.add(Dense(256, activation='relu'))
model.add(Dropout(0.35))
model.add(Dense(128, activation='relu'))
model.add(Dropout(0.25))
model.add(Dense(num_classes, activation='softmax'))
```

Compilation, optimization , data augmentation (generation) and training:

Compile and train the network

```
In [7]:
# Compile the model using optimizer
model.compile(loss=keras.losses.categorical_crossentropy,
              optimizer=keras.optimizers.Adadelta(),
              metrics=['acc']) # List of metrics to be evaluated by the model during training and testing: https://keras.io/n

# Learning rate reduction durint the training process: https://keras.io/callbacks/#reducelronplateau
learning_rate_reduction = ReduceLROnPlateau(monitor='val_acc', # quantity to be monitored (val_loss)
                                            factor=0.5, # factor by which the learning rate will be reduced. new_lr = lr * fc
                                            patience=5, # number of epochs that produced the monitored quantity with no impro
                                            verbose=1,  # 0: quiet, 1: update messages.
                                            min_lr=0.001) # Lower bound on the learning rate

# Augmentation of training data. It generates batches of tensor image data with real-time data augmentation. The data will be
datagen = ImageDataGenerator(
        rotation_range=10,        # rotate images in degrees up to the given degrees
        width_shift_range=0.1,    # shift images horizontally
        height_shift_range=0.1,   # shift images vertically
        horizontal_flip=True)     # flip images (left<->right)
# Computes the internal data stats related to the data-dependent transformations, based on an array of samples x_train
datagen.fit(x_train)

# Train the model, validate, evaluate, and present scores
history=model.fit_generator(datagen.flow(x_train, y_train, batch_size=batch_size),
                            epochs=epochs,
                            steps_per_epoch=x_train.shape[0]//batch_size,   # no of mini-batches
                            validation_data=(x_test, y_test),
                            verbose=1,
                            callbacks=[learning_rate_reduction])
```

weighted avg	0.84	0.84	0.84	10000

However, we can see that the process of network training is not over yet and should be continued for several dozen epochs.

Examples of misclassifications after 50 training epochs for a test set of 10,000 examples: The number of misclassifications decreased from 7929 after 3 epochs to 1615 after 50 epochs.

```
Number of misclassified examples:  7929
Misclassified examples:
[   0    3    4 ... 9994 9995 9999]
```
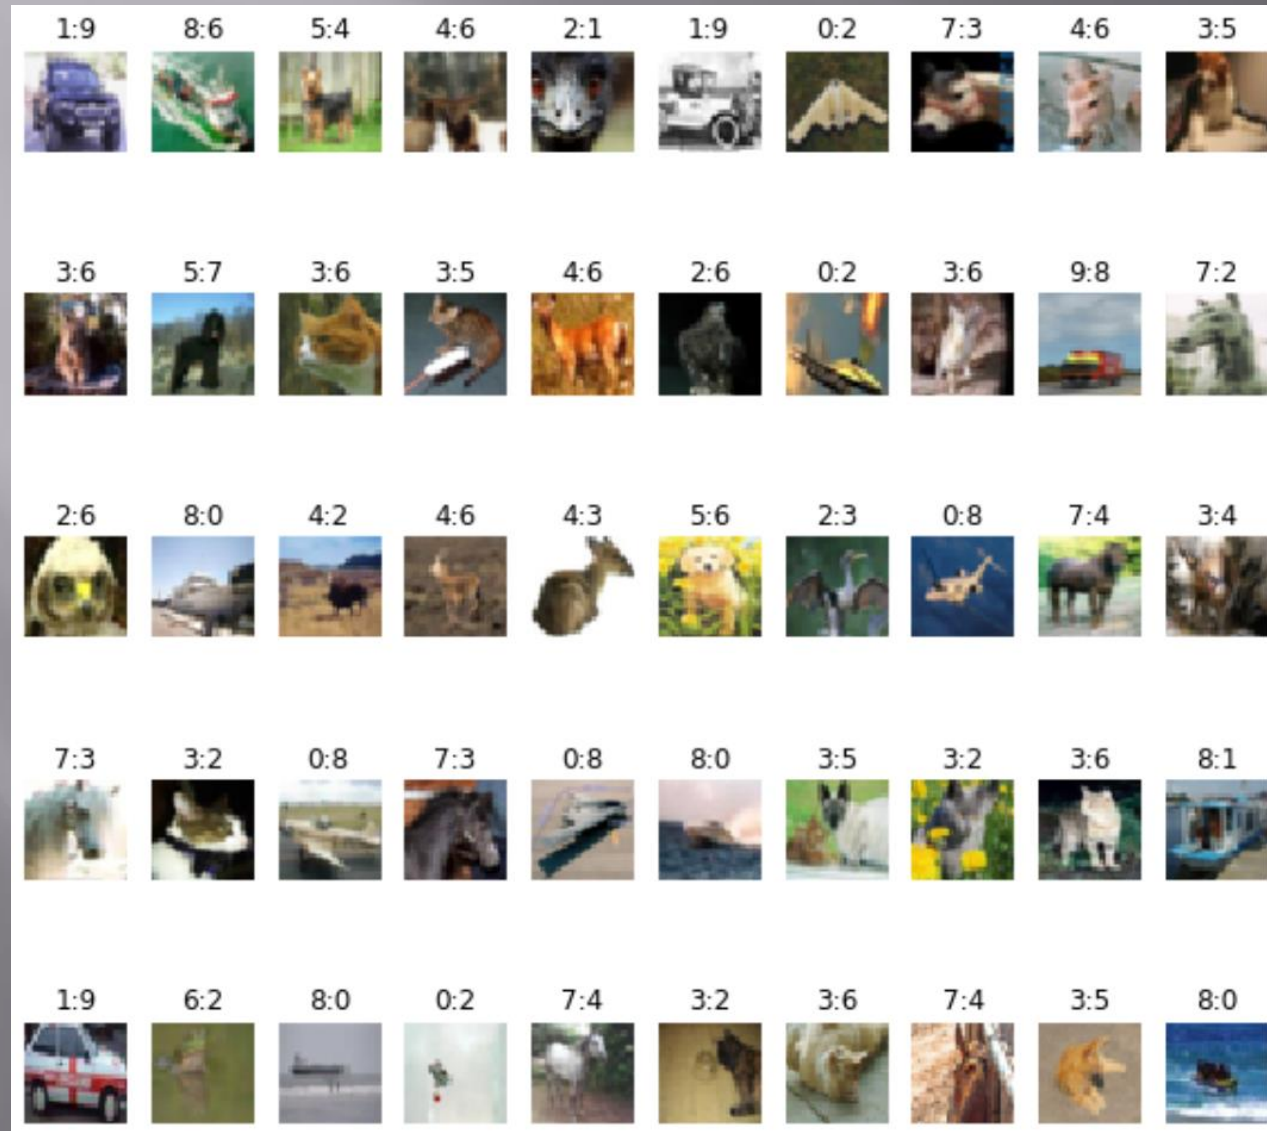

```
Number of misclassified examples:  1615
Misclassified examples:
[   9   15   24 ... 9982 9985 9996]
```

We can see that in the case of this training set, the convolution network should be taught much longer (16.15% of incorrect classifications remain) or the structure or the hyperparameters of the model should be changed.

Sample misclassified examples:

airplane	0
automobile	1
bird	2
cat	3
deer	4
dog	5
frog	6
horse	7
ship	8
truck	9

Sample misclassified examples:
airplane	**0**
automobile	**1**
bird	**2**
cat	**3**
deer	**4**
dog	**5**
frog	**6**
horse	**7**
ship	**8**
truck	**9**

Hyperparameter Experiments

According to the lectures experiment with hyperparameters of these models:

➢ Try to achieve better performance

➢ Try to change optimizers, regularization method, data augmentation ranges and parameters, learning rate, training procedure (fitting the model) etc.

➢ Change the network structure: layers and number of convolutional feature detectors (slices).

➢ Download another dataset (e.g. from UCI ML Repository) and try to adapt the classification models using convolutional neural networks (CNN) developed for the MNIST or CIFAR-10 to this dataset.

Let's start with powerful computations!
